modern computer technology has opened up several new possibilities for optimizing the administration of educational and psychological tests in computer adaptive testing cat tests are automatically tailored to the proficiency level of the individual examinees currently nearly all large scale testing programs in the western world are already adaptive or in the process of becoming so written by active cat researchers from europe and north america the chapters offer a comprehensive introduction to the latest developments in the theory and practice of cat the book can be used both as a basic reference on the state of the art in cat and a valuable resource in graduate courses on test theory the theoretical chapters in this book cover such topics as item selection and ability estimation item pool development and maintenance item calibration and model fit and testlet based adaptive testing the practical chapters describe the operational aspects of existing large scale cat programs

explores mathematical statistics in its entirety from the fundamentals to modern methods this book introduces readers to point estimation confidence intervals and statistical tests based on the general theory of linear models it provides an in depth overview of the following analysis of variance anova for models with fixed random and mixed effects regression analysis is also first presented for linear models with fixed random and mixed effects before being expanded to nonlinear models statistical multi decision problems like statistical selection procedures bechhofer and gupta and sequential tests and design of experiments from a mathematical statistical point of view most analysis methods have been supplemented by formulae for minimal sample sizes the chapters also contain exercises with hints for solutions translated from the successful german text mathematical statistics requires knowledge of probability theory combinatorics probability distributions functions and

sequences of random variables which is typically taught in the earlier semesters of scientific and mathematical study courses it teaches readers all about statistical analysis and covers the design of experiments the book also describes optimal allocation in the chapters on regression analysis additionally it features a chapter devoted solely to experimental designs classroom tested with exercises included practice oriented taken from day to day statistical work of the authors includes further studies including design of experiments and sample sizing presents and uses ibm spss statistics 24 for practical calculations of data mathematical statistics is a recommended text for advanced students and practitioners of math probability and statistics

is the topic analog testing and diagnosis timely yes indeed it is testing and diagnosis is an important topic and fulfills a vital need for the electronic industry the testing and diagnosis of digital electronic circuits has been successfully developed to the point that it can be automated unfortunately its development for analog electronic circuits is still in its stone age the engineer's intuition is still the most powerful tool used in the industry there are two reasons for this one is that there has been no pressing need from the industry analog circuits are usually small in size sometimes the engineer's experience and intuition are sufficient to fulfill the need the other reason is that there are no breakthrough results from academic research to provide the industry with critical ideas to develop tools this is not because of a lack of effort both academic and industrial research groups have made major efforts to look into this problem unfortunately the problem for analog circuits is fundamentally different from and much more difficult than its counterpart for digital circuits these efforts have led to some important findings but are still not at the point of being practically useful however these situations are now changing the current trend for the design of vlsi chips is to use analog digital hybrid circuits instead of digital circuits from the past therefore

even ix x preface though the analog circuit may be small the total circuit under testing is large

three methods of item response theory irt linking common item common group and a combination of common item and common group referred to as common common

linking designs were compared using real testing data from an english as second language esl exam program the methods were considered as vertical scaling instead of equating because first the test was designed to examine three different traits of english ability multidimensional irt and factor analysis on testing data confirms that the test was multidimensional second the two test forms are not at the same difficulty level the averaged difficulty parameters were different by about 0.5 to 1.0 or 1.5 standard units thus the linking was considered vertical the effects of test length and averaged difficulty level differences were also analyzed for practical reasons the anchor test used in the common item linking design could not represent all the dimensions of the test forms
